

RETAIL MARKET SURVEY ANALYSIS

PROJECT BRIEF & BUSINESS OBJECTIVE

1. PROJECT BACKGROUND

Retail market research provides valuable information about product availability, brand presence, pricing, and market competition. This project was undertaken to collect and analyse first hand market data from retail shops in New Market.

The study focused on the biscuit category and aimed to convert manually collected retail information into structured, meaningful business insights using Microsoft Excel.

2. BUSINESS PROBLEM

Retail market information is often collected in an unstructured form, making it difficult to compare products, brands, prices, and market presence.

The key challenge addressed in this project was:

How can raw retail market data be organised and analysed to identify useful patterns and insights related to the biscuit market?

3. PROJECT OBJECTIVES

- Collect primary data from retail shops.
- Organise the collected information into a structured dataset.
- Prepare the data for analysis.
- Analyse product and brand-level market information.
- Identify patterns and trends using PivotTables.
- Develop an interactive Excel dashboard.
- Generate meaningful insights from the analysed data.

4. DATA COLLECTION APPROACH

The data was personally collected through visits to retail shops in New Market. Relevant information related to biscuit products and their market presence was recorded and later organised in Microsoft Excel for analysis.

The project therefore represents a practical primary data collection and market research exercise.

5. ANALYTICAL APPROACH

The project followed the following process:

Step 1: Primary Data Collection

Market information was collected directly from retail outlets.

Step 2: Data Organisation

The collected information was entered and structured in Microsoft Excel.

Step 3: Data Preparation

The dataset was reviewed and prepared to improve consistency and make it suitable for analysis.

Step 4: Data Analysis

PivotTables and Excel-based analysis were used to compare and summarise the collected information.

Step 5: Data Visualisation

Key findings were presented through an Excel dashboard.

Step 6: Insight Generation

The analysis was used to identify relevant market patterns and observations.

6. KEY ANALYTICAL AREAS

- Product-level analysis
- Brand-level comparison
- Price analysis
- Market availability
- Retail product presence
- Category-level trends

7. EXPECTED BUSINESS VALUE

The analysis can help identify market patterns and provide a structured view of product and brand presence within the selected retail market.

Such insights can support better understanding of market competition, product availability, pricing patterns, and retail-level performance.

8. PRIMARY TOOL

Microsoft Excel

9. PROJECT OUTPUT

The final output of the project is an Excel workbook containing the collected data, data preparation, PivotTable analysis, and dashboard visualisation.
