

RETAIL MARKET SURVEY ANALYSIS

PROJECT SUMMARY

1. PROJECT OVERVIEW

This project involved conducting primary market research and analysing retail data from the biscuit category. The data was personally collected through visits to retail shops in New Market and subsequently organised and analysed using Microsoft Excel.

The project demonstrates the complete process of transforming raw market information into structured analysis and visual business insights.

2. PROJECT OBJECTIVE

The primary objective was to understand product and brand presence within the selected retail market and identify meaningful patterns related to product availability, pricing, and market presence.

3. PROJECT PROCESS

The project followed a structured analytical workflow:

- Primary data was collected directly from retail shops.
- The collected information was entered and organised in Microsoft Excel.
- The dataset was prepared and structured for analysis.
- PivotTables were created to summarise and compare the data.
- Key findings were visualised through an Excel dashboard.
- The analysed data was used to generate market-related insights.

4. ANALYTICAL APPROACH

Microsoft Excel was used throughout the project for data organisation, preparation, analysis, PivotTable development, and dashboard creation.

The analysis focused on identifying patterns and comparisons related to products, brands, pricing, and retail market presence.

5. KEY LEARNING OUTCOMES

Through this project, I developed practical experience in:

- Collecting primary market data
- Structuring raw datasets
- Preparing data for analysis
- Creating PivotTables
- Analysing market information
- Developing Excel dashboards
- Interpreting data patterns
- Converting data into business insights

6. SKILLS DEMONSTRATED

Data Collection | Data Preparation | Data Cleaning | Excel Analysis | PivotTables | Data Visualization | Dashboard Development | Market Research | Business Insight Generation

7. TOOL USED

Microsoft Excel

8. PROJECT VALUE

The project demonstrates practical, end-to-end experience in working with real-world data. Unlike a purely theoretical dataset analysis, the project involved personally collecting market information and converting it into structured analytical outputs.

This reflects the ability to work through the complete data analysis process, from data collection to insight generation.

9. PROJECT OUTCOME

The final outcome was an Excel-based market analysis workbook containing the collected dataset, data preparation, PivotTable analysis, and a dashboard presenting key findings.

The project demonstrates how Microsoft Excel can be used to transform raw market research data into structured analysis and meaningful business insights.
